## About JIRA Worklog Query Plugin

Worklog Query Plugin is a JIRA plugin enabling its users to run worklog queries and apply parameters on these queries through RESTful services. The plugin handles queries according to user roles, therefore, these queries can only be run on worklogs the user has appropriate permissions to access. Various filtering parameters can also be set up to narrow down the search results to a certain interval of time, user, user group and/or project. The result of the worklog query is served in JSON format.

This documentation is for JWQP 1.3.3 and 3.0.1.
